RESEARCH METHODOLOGY

The proposed research work is related with the past and hence we adopt the historical research method.

For this research work, one has to gather the secondary data from historical evidence. For this, external criticism involves the process of establishing the authenticity of source. On the other hand, internal criticism aims at establishing the validity of the content of the source. Lastly, historical data will be interpreted, analyzed and studied.

Therefore material which forms basis of the study includes

1. The official published reports
2. e-journals
3. Printed journals (periodicals)
4. Books and e-books
5. Scientific reports
6. Articles

The historical research with an insight will be able to encompass all of the known information and interrelate it. The aim of the author is to overcome pre-existing notions whereby one can bring out a new relationship or explanation or finding if it exists in the data. Thus, historical research is usually not easy as it would appear to be. It is an exacting task requiring a high level of scholarship.
