AIMS AND OBJECTIVES

The present study will be undertaken to find out the gross, histological changes and histochemistry changes in the placenta of PIH women and Gestational diabetes mellitus.

Effort will also made to find out its effect on foetal outcome.

Final outcome of our study will deal with:-

• To find out the correlation between PIH and Atherosclerosis in placental bed.

• To find out any correlation between GDM and Atherosclerosis in placental bed.

• To find any correlation between maternal cotyledon and foetal cotyledon with Gestational diabetes mellitus/PIH.

• To find out any correlation between PIH/GDM and Calcification in placental bed.

• To find out any correlation between PIH/GDM and Infarction in placental bed.

• To know Angiotensinogen polymorphism in Preeclampsia.

• To know Adiponectin level in Gestational Diabetes Mellitus.
