USEFULNESS OF STUDY

Medical Research are conducted to find early detection of pathology, its pathophysiology, macro & microscopic anatomy of pathology, pathogenesis and its clinical trial by recent and advance medical and surgical methods for the health care of human being.

**Diagnostics:**

- Early detection of biomarker in body fluid eg Angiotensionen polymorphism
- Early detection by advance imaging technique eg USG/Colour Doppler for development of placenta, gross view, morph metric analysis of capillary tree, number of cotyledons.

**Medical practitioners:**

- Early detection help early treatment planning and abortion as required.
- Preeclampsia, eclampsia and GDM can be very well managed medically, if detected as early as possible.
- Foetal outcome can also be improved, if detected as early as possible.
- Develop safe delivery practice.
- Early detection can be preventive and curative.

**Research Scholars:**

- Help present & future research scholar to understand the concept & methodology, for more advance study and explore more ideas for betterment of mankind.
**General Public:**

- It will improve mortality and morbidity rate due to preeclampsia, eclampsia and GDM
- Foetal outcome due to Preeclampsia, Eclampsia and GDM will improve.
- Life threatening emergency can be avoided.
- It will improve quality of life.
